

Andrew Murphy

My program compiles correctly.

My program runs correctly.

Program takes around 3ish minutes to finish.

I can't get the last sample query to give the correct answer (select * from performance order by TickerReturn – IndustryReturn DESC limit 6;)

I use my old code for accounting for splits as a separate function that returns a Deque like in assignment 2 but then I make a new arraylist and copy it over instead of making it work initially with an arraylist.

Assignment took me around 14 hours to complete.

Grading Criteria	Points	Expected Score
Correct output: The program correctly executes the analysis and inserts the correct answers into the Performance table	33	27
The program obeys the constraints	2	2
The program has good design and style	2	2
The write up is complete	1	1
The Program correctly executes in less than 2 minutes and successfully creates the Performance table	1.5	1
The filename format is correct	0.5	0.5
